

MoltenVR

PCVR on Apple Silicon, streamed to any ALVR headset

FRESH INSTALL

Set up MoltenVR from scratch

A clean Mac to VR streaming in about five minutes. The setup wizard does the heavy lifting.

1

Download & open MoltenVR

Grab `MoltenVR-Preview-vX.Y.Z.zip` from the GitHub [Releases](#) page, unzip, drag **MoltenVR.app** to `/Applications`, and open it (**right-click** → **Open** the first time — the preview isn't notarized yet). The setup wizard appears on first launch.

2

System check

The wizard verifies the streaming bridge and OpenXR runtime (bundled — always green on a release build) and looks for optional extras: `adb` for USB streaming, BlackHole for game audio. Anything missing shows the exact `brew` command that fixes it. Audio and USB are optional — Wi-Fi streaming works without them. Hit **Continue**.

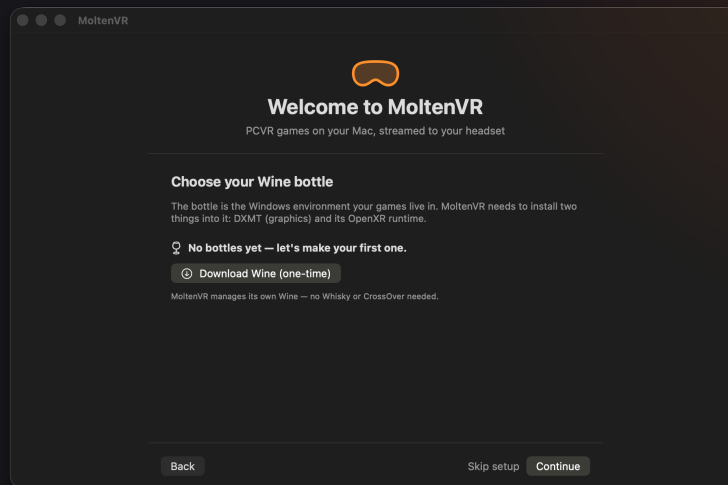

The system check — red rows show the copy-paste fix, and nothing optional blocks you.

3

Download Wine — one time, one click

Games need a Windows environment (a **bottle**). On a fresh Mac the wizard offers **Download Wine (one-time)** — about 330 MB, managed entirely by MoltenVR. No Whisky, no CrossOver, nothing else to install.

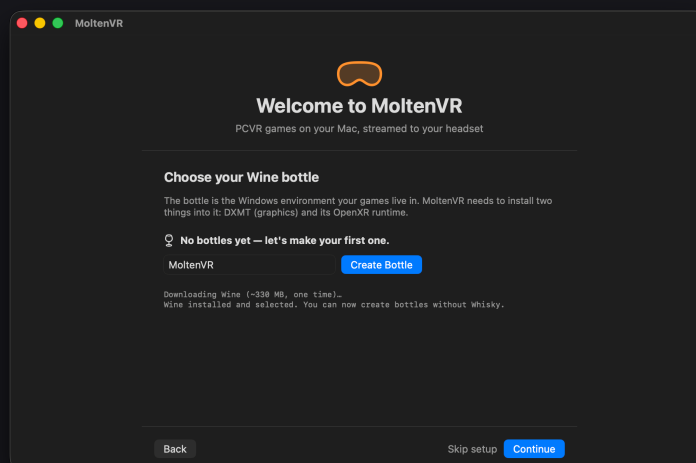

First run: no bottles yet — the wizard offers the download right there.

4

Create your bottle

When the download finishes the field flips to **Create Bottle**. Keep the default name or pick your own, click it, and give the Windows prefix a minute to initialise.

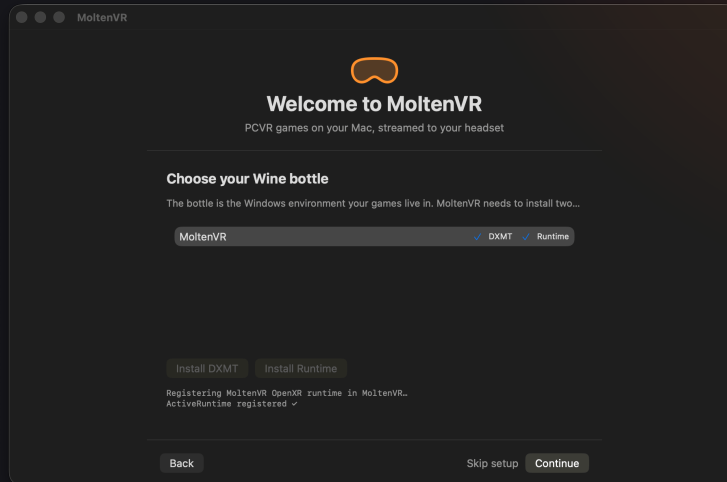

Wine installed — name the bottle and click Create Bottle.

5

Install the VR runtime

The new bottle appears with **DXMT** ✓ already lit — MoltenVR's Wine ships the graphics layer built in. Click **Install Runtime** and the row shows **DXMT** ✓ **Runtime** ✓: the bottle is VR-ready. Hit **Continue**, then **Start using MoltenVR**.

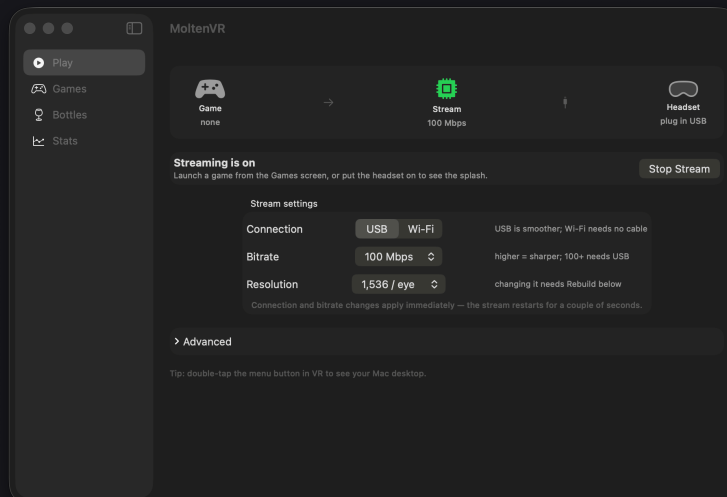

One click later the bottle is VR-ready — DXMT and the OpenXR runtime both checked.

6

Stream

On the **Play** screen press **Start Stream**, put the headset on, and open the ALVR app (v20.14.0). Pick USB (smoother, needs `adb`) or Wi-Fi. From here: install Steam into the bottle from the **Bottles** tab and launch games from the **Games** tab.

Streaming live — game audio, bitrate and resolution are all adjustable mid-stream.

Next: the *Beat Saber Setup Guide* walks through installing Steam and your first game, and *Bottles & DXMT* explains what's under the hood. Both are in `docs/guides` and on Discord.
