

MoltenVR

PCVR on Apple Silicon, streamed to any ALVR headset

HOW IT WORKS

Bottles & DXMT, explained

What a Wine bottle is, how to make one, and why DXMT is the layer that makes your GPU speak Windows.

What's a **bottle**?

A bottle is a self-contained Windows environment — its own `C:\` drive, registry, and settings — that your games install into and run from. MoltenVR creates bottles with its own downloaded, managed Wine build (WhiskyWine/GPTK), so you don't need Whisky, CrossOver, or any other Wine app. Already have one of those? MoltenVR can use your existing Whisky, CrossOver, or Wineskin bottles too.

What's **DXMT**?

Windows games draw graphics with Direct3D 11. Macs speak Metal. **DXMT** is the translation layer that converts D3D11 calls to Metal in real time, so the game renders natively on Apple Silicon. MoltenVR installs it into the bottle as native-flavour DLLs with a global override — games pick it up automatically, nothing to configure per game.

Create a bottle with DXMT — 4 clicks

1. Open the **Bottles** tab, type a name, and click **Create**. MoltenVR fetches its managed Wine on first use and initialises the bottle.
2. Select the bottle and click **Install DXMT**. Wait for the green *installed* check.
3. Click **Register OpenXR Runtime** so VR titles find MoltenVR instead of looking for SteamVR.
4. Click **Install Steam**, then **Launch Steam** and log in. (**Launch .exe...** runs any Windows game directly, no Steam needed.)

Done when the bottle row shows **DXMT ✓ Runtime ✓ Steam ✓**. Hit **Rescan** any time to refresh the checks.

The Bottles tab — DXMT installed, runtime registered, Steam ready. All green means go.

DXMT or D3DMetal?

The Bottles tab offers both. They do the same job — D3D11 on Metal — via different routes:

LAYER	WHAT IT IS	WHEN TO USE IT
DXMT	Open-source D3D11 → Metal translation (3Shain/dxmt). Installed as native DLLs with a global override.	Default choice. Verified with Beat Saber, Half-Life: Alyx (via DXVK), and the rest of the tested list.
D3DMetal	Apple's translation layer from the Game Porting Toolkit, shipped in the managed Wine build.	Fallback if a specific game misrenders or crashes under DXMT. One click to switch — try it per bottle.

Good to know

One bottle is fine for most people. Steam and all your Steam VR games can live in a single bottle. Make a separate bottle when you want isolation — e.g. one for a heavily modded Beat Saber and one kept clean.

Performance is baked in. Bottles launch with esync enabled (`WINEESYNC=1`) for fast in-game and Steam-download performance — the app manages this for every launch, nothing to set.

Existing bottles keep their layout. Point MoltenVR at a Whisky/CrossOver/Wineskin bottle and it installs DXMT and the runtime into it without touching your games.

Troubleshooting. Steam won't start or downloads crawl after an update? Use **Update Wine (fixes Steam)** in the Bottles tab. A game renders wrong? Swap DXMT ↔ **D3DMetal** and relaunch. Checks not updating? **Rescan**. Anything else — grab the bottle log from the Bottles tab and open an issue or ask in Discord.

Next step: games. See the companion *Beat Saber Setup Guide* for the full download-to-launch walkthrough, including patching and streaming.
